

# Package ‘GauPro’

November 1, 2016

**Type** Package

**Title** What the Package Does (Title Case)

**Version** 0.1

**Date** 2016-11-01

**Author** Emanuel Huber

**Maintainer** Emanuel Huber <emanuel.huber@alumni.ethz.ch>

**Description** A package to simulate conditional and unconditional Gaussian process (GauPro).

**License** What license is it under?

**LazyData** TRUE

**LinkingTo** Rcpp, RcppEigen

**Imports** Rcpp,  
RcppEigen,  
FastGP

**RoxygenNote** 5.0.1

GauPro-package	<i>GauPro: A package for simulating conditional and unconditional Gaussian Process.</i>
----------------	-----------------------------------------------------------------------------------------

---

### Description

The GauPro package provides R functions for Gaussian process (GP) modelling. The core functions are coded in C++ and based on the EIGEN library.

### Features

- Conditional GP simulation
- Space-time GP
- GP with monomial mean functions
- GP conditioned to derivative observations

### References

Several books!

---

cholfac	<i>Return the lower Cholesky factor</i>
---------	-----------------------------------------

---

### Description

Return the lower Cholesky factor L such that  $X = L t(L)$

### Usage

```
cholfac(x)
```

---

covm	<i>Covariance matrix</i>
------	--------------------------

---

### Description

Create a covariance matrix according to the model

### Usage

```
covm(x, y, covModel, d = 0, dx = 1, ...)
```

---

gpCond	<i>Conditional Gaussian Process simulation</i>
--------	------------------------------------------------

---

**Description**

Conditional Gaussian Process simulation

**Usage**

```
gpCond(obs, targ, covModels, sigma = 0, op = 0, bc = NULL, sigmat = 0)
```

---

gpSim	<i>Simulate a Gaussian Process</i>
-------	------------------------------------

---

**Description**

Simulate a Gaussian Process

**Usage**

```
gpSim(A, L = NULL, n = 1)
```

---

invM	<i>Inverse matrix</i>
------	-----------------------

---

**Description**

This function first try the Cholesky decomposition

**Usage**

```
invM(x)
```

---

linear	<i>linear covariance matrix</i>
--------	---------------------------------

---

**Description**

linear covariance matrix

**Usage**

```
linear(x, y, covModel, d = 0, w = 1)
```

---

matern	<i>Matern covariance matrix</i>
--------	---------------------------------

---

**Description**

Matern covariance matrix

**Usage**

```
matern(r, covModel, d = 0, w = 1)
```

---

matGrid	<i>Create grid</i>
---------	--------------------

---

**Description**

Create grid

**Usage**

```
matGrid(x, y)
```

---

mvrnorm2	<i>Multi-variate Gaussian simulation</i>
----------	------------------------------------------

---

**Description**

A more robust alternative to the mvrnorm function.

**Usage**

```
mvrnorm2(n, mu, Sigma)
```

---

se	<i>Squared Exponential Covariance Function</i>
----	------------------------------------------------

---

**Description**

Squared Exponential Covariance Function (or radial basis or Gaussian) over-smoothness, infinitely differentiable at  $h=0$

**Usage**

```
se(r, covModel, d = 0, w = 1)
```

---

setPosTime	<i>Reshape target</i>
------------	-----------------------

---

**Description**

Reshape target

**Usage**

setPosTime(xy, tt, val, xystar)

---

vecGrid	<i>Create vecgrid</i>
---------	-----------------------

---

**Description**

Create vecgrid

**Usage**

vecGrid(x, y)
