

Package ‘GauProMod’

November 1, 2016

Type Package

Title Gaussian Process Modelling

Version 0.1

Date 2016-11-01

Maintainer Emanuel Huber <emanuel.huber@alumni.ethz.ch>

Description A package for conditional and unconditional Gaussian Process Modelling (GauProMod).

| GauProMod-package | <i>GauProMod: A package for simulating conditional and unconditional Gaussian Process.</i> |
|-------------------|--|

Description

The GauProMod package provides R functions for Gaussian process (GP) modelling. The core functions are coded in C++ and based on the EIGEN library.

Features

- Conditional GP simulation
- Space-time GP
- GP with monomial mean functions
- GP conditioned to derivative observations

| | |
|---------|---|
| cholfac | <i>Return the lower Cholesky factor</i> |
|---------|---|

Description

Return the lower Cholesky factor L such that $X = L t(L)$

Usage

cholfac(x)

| | |
|------|--------------------------|
| covm | <i>Covariance matrix</i> |
|------|--------------------------|

Description

Create a covariance matrix according to the kernel parametrisation

Usage

covm(x, y, covModel, d = 0, dx = 1, ...)

`gpCond`*Conditional Gaussian Process simulation*

Description

Conditional Gaussian Process simulation

Usage

```
gpCond(obs, targ, covModels, sigma = 0, op = 0, bc = NULL, sigmat = 0)
```

`gpSim`*Simulate a Gaussian Process*

Description

Simulate a Gaussian Process

Usage

```
gpSim(A, L = NULL, n = 1)
```

`invM`*Inverse matrix*

Description

This function first try the Cholesky decomposition

Usage

```
invM(x)
```

| | |
|---------|--|
| kernels | <i>Kernels (covariance functions) for Gaussian process</i> |
|---------|--|

Description

Squared Exponential Covariance Function (or radial basis or Gaussian) over-smoothness, infinitely differentiable at $h=0$

Usage

```
kGaussian(r, para, d = 0, w = 1)
```

```
kLinear(x, y, para, d = 0, w = 1)
```

```
kMatern(r, para, d = 0, w = 1)
```

| | |
|---------|--------------------|
| matGrid | <i>Create grid</i> |
|---------|--------------------|

Description

Create grid

Usage

```
matGrid(x, y)
```

| | |
|---------|--|
| mvnorm2 | <i>Multi-variate Gaussian simulation</i> |
|---------|--|

Description

A more robust alternative to the mvnorm function.

Usage

```
mvnorm2(n, mu, Sigma)
```

| | |
|------------|-----------------------|
| setPosTime | <i>Reshape target</i> |
|------------|-----------------------|

Description

Reshape target

Usage

setPosTime(xy, tt, val, xystar)

| | |
|---------|-----------------------|
| vecGrid | <i>Create vecgrid</i> |
|---------|-----------------------|

Description

Create vecgrid

Usage

vecGrid(x, y)
